Basic Arabic Dictionary Learn a new language: Arabic Languages: English, Arabic Category: Education L-Lingo Arabic Free Version - by Hael Software See larger Screenshots below..1. Field of the Invention The present invention relates to medical imaging apparatuses, and particularly to a medical imaging apparatus used to display three-dimensional images of a subject acquired by projection scanning such as X-ray computed tomography (CT) and computed tomography (CT). 2. Description of the Background Art In a medical imaging apparatus used to display three-dimensional images by radiation, the size of a subject needs to be large for acquiring image data at high resolution. For this reason, a medical imaging apparatus for obtaining images by projection scanning (such as X-ray CT and CT) has been conceived. As an example of the medical imaging apparatus for projection scanning, an apparatus described in Japanese Patent Application Laid-Open No. 6-43850 is disclosed. In the apparatus, X-ray beams emitted from two X-ray sources are deflected in a spiral scanning pattern such that X-ray beams pass through a subject with a constant projection angle of 180 degrees, and three-dimensional images are acquired by a two-dimensional X-ray detector. An apparatus described in Japanese Patent Application Laid-Open No. 2003-272919 is also conceived as an example of such a medical imaging apparatus for projection scanning. In the apparatus described in the above Japanese Patent Application Laid-Open No. 2003-272919, the X-ray sources, an X-ray detector, and so on are provided around a subject, and thus the apparatus is large. As a method for realizing a slim apparatus, projection scanning is conceivable. In the case of projection scanning, data of two-dimensional views (projection views), which are acquired at a constant angle, is output from the X-ray detector in one frame period, and thus the amount of data is large. In the case of apparatus disclosed in Japanese Patent Application Laid-Open No. 2003-272919, the X-ray sources, the X-ray detector, and so on are arranged around a subject, and thus when projection scanning is performed, a subject moves in the apparatus in order to acquire projection views. As described above, when projection scanning is performed, a three-dimensional image is acquired by taking into account movement of a subject in the apparatus, i.e., a subject moves in the apparatus.
