the k-station has a dedicated 'poly' control which allows the user to set the maximum polyphony, and this can be set to two, four or eight voices, in two modes. the software side of the pgmk-controller is very limited, and its interface is awkward at best. it displays the current waveforms and the waveforms of the unison voices, and a separate vu-display for each oscillator and unison voice. the control panel can be switched to full size, but the unit can only be read from the front or back, not both sides at once. the output channels can be switched by turning a little knob which also selects the unison voices, but one of the channels will be selected for the unison voices even if the patch containing the unison voices has been turned off. the k-station can handle two stereo channel patches, one for each output channel, but these can only be used in mono mode, not stereo. the final part of the k-station which needs a little explanation is its patch memory. this is a big rectangular patch memory with a single tiny window at the top. the patch memory is divided into 8 segments, and each segment can be assigned to a unison voice. or to a stereo channel. or to a mono channel. the default setting is to assign all 8 segments to all 8 unison voices. however, the patch memory can be manually set by the user so that only one unison voice is assigned to one of the segments. this means that you can assign just the odd unison voices (1, 3, 5,...) to one segment and the even unison voices (2, 4, 6,...) to the next segment. for example, if the pianist is using the left hand only and all other voices are assigned to the right hand, then all four unison voices can be assigned to the first segment and only one unison voice can be assigned to the second segment. in this case the 'poly' control is set to two voices, so the two unison voices will be present in the sound and can be heard together or separately. this method is better than assigning all unison voices to one segment, as in this case all voices are always playing and the voice assignment to a segment only exists when one of the voices is not currently playing. as such, the k-station can be used as a realistic polyphonic amplifier with a reasonable level of realism.

the site is easy to navigate and you have the option of searching either for synths by model, or by category. the first option is particularly useful if you are looking to find a particular model, as it allows you to search in this way for as many as 100 models at a time. if you simply search for 'v-station', you will find lots of synths to choose from, so searching by model is a useful option. the category option is similar, and allows you to search for free sample packs, or 'samples packs', 'synth packs', 'v-station stems', 'price', 'hobbies', 'midi' and 'packages'. each category is displayed in the left-hand column, and clicking on one of the category names brings up a list of synths in that category. if you click on a synth's name, you will be taken to a page with details about the synth, and you can download any demo files available, the factory serial number, a demo track, and a video overview of the synth. it's worth mentioning that there is a useful feature on the main page that allows you to search for all synths, which is especially useful if you are looking for a particular synth and do not know its model name or serial number. this allows you to find all synths by model and serial number. this does, of course, mean you are more likely to get 'bogged down' by a lot of synths, but at least you will find what you are looking for. the search function is very simple and works as follows: by typing in some text you want to search for, you'll be shown a list of matching records on the left-hand column; on the right-hand column you can see a list of synths with a matching model name and serial number. you can then choose one of the synths from the list, and be taken to the pages for that synth. the good thing about this is that you don't have to worry about whether the synth's model or serial number is correct. you can also check a synth's price (including shipping, where applicable), but this is not always easy to find. for example, the cost of the v-station is £134.99, but this is not displayed on the main page, and it is not immediately obvious how to find it. nor is the cost of the k-station, which is priced at £99.99, as it should be. this lack of price information is not a problem with the search function, but it is a problem with the website in general.
