KeyMacro is a graphical macro recorder, a tool that lets you record keyboard actions of your choice. This software will record what you type, what windows are open, and what applications you use. KeyMacro can be configured to record mouse clicks, as well, but that's not its purpose. It's meant to help you solve repetitive tasks. It's like writing a script that repeats itself at all times. You don't write code for the compiler to compile it. You write it, save it, and later on execute it. Powerful graphics editor KeyMacro's graphical user interface is simple, yet very effective. It is made from a single window, showing the macro editor, the recording window, and the clipboard. The macro recorder is fully customizable. The macro recorder is able to auto-record to a file, allowing you to write a series of macros, save them, and re-play them. You can also set key combinations or select the recording mode, which includes mouse clicks, app windows, screenshots, or toolbars. Fully customizable editing KeyMacro offers more than 25 different keyboard actions. It can include key combinations, mouse clicks, hotkeys, and even custom menu actions. You can record a different macro for each shortcut, and assign them to a category. Record macros as fast as you want KeyMacro can be set to auto-record. You can also manually start and end recording, or choose the start and end of a recording. You can also perform macros without having the application active. This is useful to save memory on your computer. You can run macros from a program file, and the macro's functions will be visible in the app's menu. Enhance your macros You can split the recording window into multiple clips, and apply color effects to the frames. You can also zoom in on a frame, or remove the clipping boundaries for more flexibility. You can always save a recorded macro as a video file, which you can later play to enhance the resulting recording. Use the macro recorder The macro recorder can be used to write a series of commands to be executed repeatedly. You can either save the macros as executable files, or copy the recorded macros to the clipboard. You can control these macros using any editor. For instance, you can run macros from a Windows shell, Windows explorer, VBScript, Perl, Python, Ruby, JScript, or a JavaScript editor. Once the macro has been executed
