In this release of Photoshop, we improved the Camera Raw panel to make it easier for developers to access Camera Raw enhancements and color correction tools. Also, we've made it possible to access your Adobe Stock Library in the panel. Now, when you select a product in your library, users can see refreshes to Canon, Nikon, and Olympus camera models that use that camera brand. Additionally, we fixed a bug where the High Resolution option was hidden in the latest release. In Picture & Formats, we allowed you to select WebP as your format by default, allowing you to improve support across both Web and mobile experiences. You can now also choose which color space your images should use when resampling and converting. We've added an option to better support color management in your images. Update: Our previous release of the latest version of Photoshop was shipped without support for Principled Setups. We've released a fix for this issue and fixed a handful of bugs in that release. We've released a new version of the updates to Photoshop and Photoshop Elements. Several major mobile photo-editing apps have launched the past couple of weeks with innovative new photo management features aimed at mobile users. In this release, we introduced Face Beauty to the Mac version of Photoshop CC. Face Beauty, which we premiered in iOS 11, uses machine learning (ML) to categorize, edit and even beautify faces. With Photoshop.ai, we created a new way for you to preview edits and retouching work you create using the AI features exposed in Photoshop. Check out how Photoshop.ai provides both machine intelligence for the retouching job and the in-app interface and controls you need to manually adjust your online edits. Feel free to share these images with others. Your edits will be both stored on the device and online, so other users who have access to your mobile device can easily view and comment on your retouching results.

Elements also lets you add effects using a photo's colors, textures, and patterns, and it includes a new feature called Style Builder. It provides a gallery of six built-in and user-created styles that can be applied to a seemingly unlimited number of images. The styles are available for five categories, including Black and White, which enables you to change an image's colors and contrast, and give it a more stylized look. The other categories include Warm and Cool, which let you give your photo a more vibrational or thoughtful look, and Soft, which lets you add lightness and softness to an image. The last category, Mixed, serves as a compilation of the other four categories. The Style Builder tool lets you find the styles you want to use in one place, and then a simple drag-and-drop process lets you add existing and custom styles. You can save your new style in a separate library, and then you can apply it to multiple images. You'll find that Styles give your images a polished look. Of course, you'll also find these capabilities in Elements, but it's nice to see them in a stable, non-beta release. The features have improved with each version of Photoshop, but there are a few things such as the long startup time and the lack of new editing features that have stood still for version countless. So, in current day, Photoshop is still a great option for advanced designers and the suggestion is to use existing features as much as needed and to use plugins or type-in-place when possible. Even after all those years, Photoshop remains as good as it has always been.
